Module 1 Cheat Sheet: Python Basics

Package/Method	Description	Code Example
Comments	Comments are lines of text that are ignored by the Python interpreter when	 1. # This is a comment
Concatenation	executing the code<./td> Combines (concatenates) strings.	Copied!
		Syntax: 1. 1
		<pre>1. concatenated_string = string1 + string2</pre>
		Copied!
		Example:
		 1. 1 1. result = "Hello" + " John"
		Copied!
		Example: 1. 1
Data Types	- Integer - Float - Boolean - String	2. 2 3. 3
		4. 4 5. 5 6. 6
		7. 7 8. 8
		9. 9 10. 10
		1. x=7 2. # Integer Value 3. y=12.4
		 # Float Value is_valid = True
		<pre>6. # Boolean Value 7. is_valid = False 8. # Boolean Value</pre>
		<pre>9. F_Name = "John" 10. # String Value</pre>
Indexing	Accesses character at a specific index.	Copied! Example:
		1. 1 2. 2
		 my_string="Hello" char = my_string[0]
		Copied!
		Syntax: 1. 1
		<pre>1. len(string_name)</pre>
		Copied!
len()	Returns the length of a string.	Example:
		1. 1 2. 2
		<pre>1. my_string="Hello" 2. length = len(my_string)</pre>
lower()	Converts string to lowercase.	Copied! Example:
		1. 1 2. 2
		<pre>1. my_string="Hello" 2. uppercase_text = my_string.lower()</pre>
		Copied!
		Example: 1. 1
print()	Prints the message or variable inside `()`.	 2. 2 print("Hello, world")
Python Operators	 - Addition (+): Adds two values together. - Subtraction (-): Subtracts one value from another. - Multiplication (*): Multiplies two values. - Division (/): Divides one value by another, returns a float. - Floor Division (//): Divides one value by another, returns the quotient as an 	<pre>2. print(a+b) Copied!</pre>
		Example:
		1. 1 2. 2
		3. 3 1 4. 4

20/02/2024, 17:10 about:blank integer. - Modulo (%): Returns the remainder after division. 7. 7 1. x = 9 y = 4
2. result_add= x + y # Addition
3. result_sub= x - y # Subtraction
4. result_mul= x * y # Multiplication
5. result_div= x / y # Division
6. result_fdiv= x // y # Floor Division
7. result_mod= x % y # Modulo Copied! Example: replace() Replaces substrings. 1. my_string="Hello"
2. new_text = my_string.replace("Hello", "Hi") Copied! Syntax: 1. 1 1. substring = string_name[start:end] Copied! Slicing Extracts a portion of the string. Example: 1. 1 1. my_string="Hello" substring = my_string[0:5] Copied! Example: split() Splits string into a list based on a delimiter. my_string="Hello" 2. split_text = my_string.split(",") Copied! Example: 1. 1 2. 2 Removes leading/trailing whitespace. strip() 1. my_string="Hello"
2. trimmed = my_string.strip() Copied! Example: upper() Converts string to uppercase. 1. my_string="Hello"
2. uppercase_text = my_string.upper() Copied! Syntax: 1. 1 1. variable_name = value Copied! Variable Assigns a value to a variable. Example: Assignment 1. name="John" # assigning John to variable name 2. x = 5 # assigning 5 to variable x
